Generating Admission Report

"{original_case_report}",

Based on the information above, write a realistic medical admission report in European Portuguese for a patient upon arrival at the hospital. Use the information provided in European Portuguese and follow the writing style and terminology consistent with the provided European Portuguese case report. While writing, adopt the perspective of a doctor and remember this is not a discharge report.

Follow these guidelines:

1. Write the report as a single, unstructured paragraph in clinical language.
2. Include only symptoms, signs, and relevant history of previous diseases, using appropriate medical abbreviations (e.g., HTA, DM).
3. Do not include treatment details, exam results, specific diagnoses, or follow-up treatments.
4. Conclude the report with an indication of the initial treatment provided, specifying the administered dose, but avoid explicitly labelling this section as 'initial treatment.'

Ensure the report is in European Portuguese, not Brazilian Portuguese, and feels authentic, mimicking how a doctor might write the admission scenario. Also remember, doctors can make simple mistakes while writing (e.g., typographical mistakes).

Generating Discharge Report

"{original_case_report}" and "{generated_admission_report}" ,

Based on the information above, write a realistic medical discharge report in European Portuguese for a patient upon leaving the hospital. Use the information provided in European Portuguese and follow the writing style and terminology consistent with the European Portuguese case report. While writing, adopt the perspective of a doctor and remember this is not an admission report.

Follow these guidelines:

1. Write the report as a single, unstructured paragraph in clinical language.
2. Include a summary of the patient's stay in the hospital.
3. Include a treatment summary, details of exams and their results, discharge medications, and follow-up instructions.

Ensure the report is in European Portuguese, not Brazilian Portuguese. And feels authentic, mimicking how a doctor might write the discharge scenario. Also, remember that doctors can make simple mistakes while writing (e.g., typographical mistakes).

Generating Patients Full Journey

"{generated_admission_report}" and "{generated_discharge_report}"

Based on the admission and discharge reports provided, generate a detailed report of the patient's full journey during their hospital stay. Divide the information into multiple reports, such as 'divided days in different report-based patient situations' 'Surgery Report,' and so on, as appropriate to the events mentioned in the discharge report. If the patient underwent surgery or any operation during their stay, create a separate report detailing that specific event. Write from the perspective of a doctor, ensuring the language feels authentic and mimics how a doctor might document such scenarios. The report should be written in European Portuguese (not Brazilian Portuguese) and formatted as a single, unstructured paragraph in clinical language. Introduce small, natural errors like typographical mistakes to reflect a realistic documentation style.

The generation should be in this order,

1. Admission report (do not include date in the heading)
2. Several reports based patients situations during stay in the hospital. The report should be day-wise.
3. Discharge Report (do not include date in the heading and also must mention the whole day of staying in the hospital)
